Abstract

A snap ring for shafts or bores is proposed, which is able to be axially fixed in position by snapping it into place in a circumferential groove (32), the snap ring (10) being provided with a centering ring (17) which, in the case of the snap ring (10) being installed in the circumferential groove (32), extends with radial clearance to an annular clip (11) of the snap ring (10), which is disposed approximately concentrically to the circumferential groove (32).
